Note: Do not use more than three batteries in series

Each individual cell is spiral wound and formed to a prismatic cell. The nominal cell voltage is 3.2V. Four cells are placed in series in order to create 12.8V. To protect the battery from over charging and over discharging the battery is equiped with a internal battery management system (BMS). The BMS also takes care of

the balance between the internal cells. To avoid overheating of the battery, a special insertion, called PTC, is added to the electrolyte. This additive neutralizes the electrolyte and disables the battery permanently if the internal temperature exceeds 80°C.
